

Performance Measuring on a single compute node

Kazuhiro Suzuki and Soichi Shigeta
(FUJITSU LABORATORIES LTD.)

2016/5/18

■ System configuration

We measured using Kilo in December 2015.

■ Spec

	Physical server	VM
CPU	Xeon X2640 v2 2.0GHz (8 cores/16 threads)	2 vcpus
Memory	32GB	4GB
HDD	1TB	40GB
NIC	1GbE NIC x2	1GbE NIC
OS	Ubuntu 14.04	CentOS 7.1

■ Benchmark

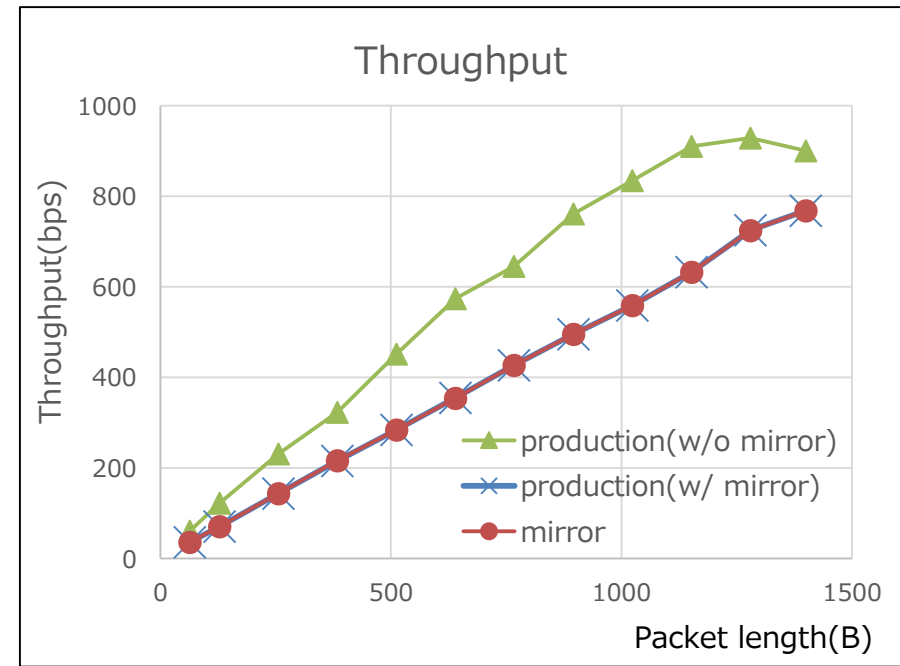

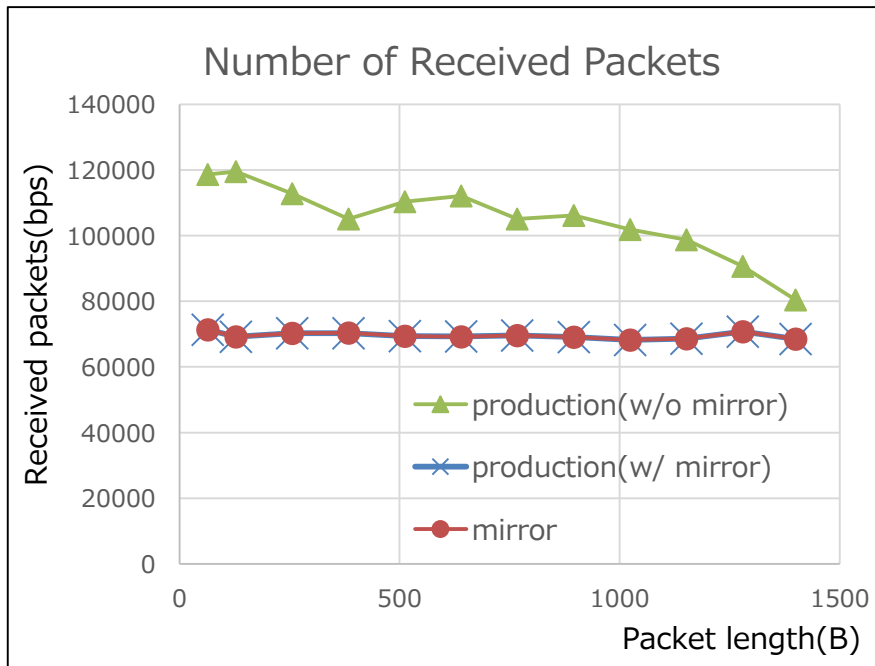

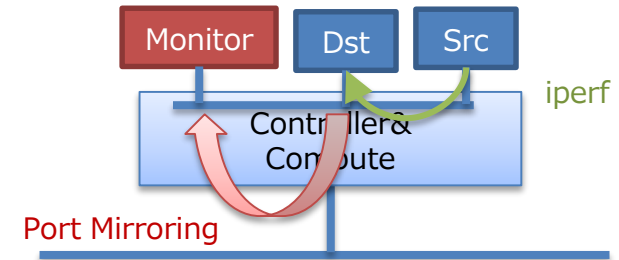

■ iperf-2.0.8

- Parameters

```
iperf -u -c <dst> -l <size> -b 1G -t 10 -P 2
```

Performance Impact

- Send UDP packets from Src to Dst by using iperf.
- Tap-flow was set on Dst VM's port.

- When the port mirroring is performed, the number of packets (production) is limited to about 70,000 pkts/sec.

Consideration

- We guess the performance is limited because of vhost-net (kernel thread) running in host become overload.
 - We find that vhost-net uses CPU 100%.
